

2022 CORN

Iowa Crop Performance Tests

Iowa's Official Variety Trials

IOWA STATE UNIVERSITY
Department of Agronomy

A summary of replicated research by Iowa Crop Improvement Association.

Iowa Crop Improvement Association

Iowa Crop Performance Tests—Corn

is conducted each year to provide information farmers need to select the best hybrids for their production conditions. This is the 103rd consecutive year for the test. Yield trial information, testing procedures, and more can be found at croptesting.iastate.edu.

Testing Procedures

Seed companies, Iowa Crop Improvement Association, and Iowa State University are eligible to enter hybrids in the Iowa Crop Performance Tests—Corn. There are three testing districts and five testing sites within each district (Figure 1). Entries were subdivided into experiments based on relative maturity, providing an early-season and full-season test within each district. This year we evaluated over 161 hybrids from 15 companies in more than 220 district-by-hybrid combinations.

Each entry was replicated four times in four-row plots at a planting rate of 34,500 kernels per acre at each location. Row spacing was 30 inches, plot length was 20 feet, and planted row length was 17.4 feet. The center two rows of each plot were harvested with a corn combine. No gleanings or dropped ears were included in yield data. A moisture determination was made from each plot and yields were corrected to 15.5 percent moisture for shelled corn. Yield determinations are based on a 20 foot plot, which includes the planted row plus the alley. This is because area in alleys may contribute to the yield of plants at the ends of planted rows.

Information Layout

Tables 3-5 contain two-year averages of agronomic information from a maximum of five locations each year. Current year district averages are shown in Tables 6-11, and entries are reported in either the early-season or full-season hybrid tests within each district. These tables contain a mean yield, moisture, and adjusted gross value based on all locations within the district. In addition, there are yield estimates based on the western fields and the eastern fields within a district. In these estimates, the location in the center of the district is used in both subcomponents. Each of these tables also contains the single-location yield for each entry. Lodging and more detailed information from the individual locations is available at croptesting.iastate.edu.

Least Squares Means

All trait means in all tables were computed using least squares means. In cases where some values are missing, this provides the best estimates of trait values across replications, locations, and years. Least squares means are not equivalent to simple arithmetic means like those computed in a spreadsheet program using raw data or location means. Least squares means should always be used in multiple-comparison tests like the Iowa Crop Performance Tests.

Interpretation of Results

Statistical analysis identifies the portion of yield differences due to variation in soil types, soil fertility, moisture availability, insect infestation, and diseases; plus any variation due to planting and harvesting techniques. The least significant difference (LSD) values for yield represent, in bushels per acre, the amount of yield variation that could be due to variations in the factors just mentioned. In comparing hybrids, yield differences greater than the LSD value can be attributed to differences in the yield potential of these hybrids; yield differences less than the LSD value are not statistically different and could have been due to other factors.

Grain moistures are indications of maturity and natural drying rate. Yield comparisons should be made among hybrids of similar maturity.

Growing conditions vary at each location. Stressful conditions, such as drought, extended periods of high temperature, or excess rainfall may affect some locations more than others. It is important to select hybrids having stable performance over a range of environmental conditions because it is not certain how next year's growing season will develop. High yields for two or more consecutive years indicate stable performance. If two-year means are not available, regional averages consisting of several locations should be used to make selection decisions. Performance data from a single location have a very low predictive probability and should not be relied upon for hybrid selection decisions.

Supplemental yield and agronomic information about specific hybrids may be obtained from seed dealers, crop consultants, and from neighbors who have grown these hybrids.

Use of Data in Advertisements

Specific advertising statements by a company about the performance of its entries must accurately reflect the published data.

CROP 3148 Revised November 2022.

Acknowledgments

This report would not be possible without the cooperative efforts of many organizations and people. Thanks to the following people for helping make our testing program a success: Aaron Sassman, Shawn Bryant , and Graydon Marzen for putting in the time to get the plots planted, keeping them maintained, and ultimately harvested; Patrick Miner of Bayer Crop Science and Chris Adams of Nutech Seed, LLC for providing us with fill plot and border row seed that is critical to our operation; the farmer cooperators, for without their help, our lives would be more difficult—they are listed in Table 1; Jode Edwards, for ongoing technical support and continued collaboration; students Emma Caspers, Brandon Burke, and William Bussey for their many hours of hard work—their efforts contributed greatly to the success of our mission; Dan McGuire and Nuwan De Silva for web design and technical support; Carol Cornelius and Doan Schmitz for helping fill the gaps whenever and wherever extra hands are needed; and our leader Jim Rouse for his expertise and ongoing support. A special thanks to all the companies who enter varieties in our tests—they are listed at the end of this report in Table 12. It is their participation and support that continues to make these tests an indispensable resource for Iowa farmers.

RM: Relative maturity in days, provided by entrant

Yield: Bushels per acre, standardized at 15.5% moisture

Moist: Harvest moisture, expressed as percent

AGV: Adjusted Gross Value, based on a price per bushel of \$7.00 and drying costs of 4 cents per point

This year we evaluated over 161 hybrids from 15 companies in 222 district-by-hybrid combinations.

Entries were distributed in three districts and two experiments per district.

Each experiment was grown at five locations, with four replicates of each entry at each location.
